

**PRESS RELEASE For immediate release**

*WareLite Ltd announces the European launch of a new physical security solution based on wireless detection of personnel position-monitoring tags*

**Event Driven software platform combines real time positioning with access control to create the WareLite Total Security Hub (TSH) Solution**

*Andover, UK, 21 November 2005* - WareLite Ltd, an innovative software research, development and marketing company, today announced the European launch of a new physical security solution, WareLite TSH, based on Wi-Fi-enabled security badges worn by visiting or employee personnel.

Aimed primarily at enhancing security of IT installations, this solution will make it easier for IT managers to physically protect their datacentres and IT resources, by extending existing access control to precisely cover sensitive locations. The WareLite TSH solution was developed jointly by WareLite and their newly-announced partner Esiet Srl.

“This is a significant development for Esiet” said Maurizio Andreoli, Esiet CEO. “WareLite BOSS gives us unparalleled flexibility in how we monitor sensor data and deal with it in the context of existing IT infrastructures. This physical security solution is just the first step. It will form the foundation for a whole range of real-time monitoring, management and response services, expanding up into managing network and IT service levels in real time”

“By combining the real-time, event-driven processing power of WareLite BOSS with off-the-shelf Wi-Fi positioning technology, this solution allows real-time monitoring of the location of visitors and staff”, said Elena Pasquali, CEO of WareLite. “And, thanks to the ease of integration offered by the BOSS platform, the TSH solution appears to users as a simple extension of their current access control systems’ capabilities: visitors to sensitive facilities are provided with a single ‘badge’ - containing both Wi-Fi and proximity tags - and their movements across areas of a few square meters are monitored via current security systems, removing the need for a separate point solution”

Primary markets for WareLite TSH are banks, telecoms and other organisations where security of IT resources is paramount. Further developments are planned for manufacturing, aerospace and defence markets.

A note to Editors:

WareLite BOSS is a platform for the execution of event driven, flexible, horizontally scalable business processes. WareLite BOSS finds its ideal application in the execution of sensor driven, high performance processes. Sensor technologies used in conjunction with WL BOSS include RFID, Barcode, Wireless Positioning, GPS, POS etc.

Thanks to their Partners network, Esiet design, develop and implement solutions for IT Infrastructure Deployment and Management, combining Consulting Services with Event Driven Software Design & Deployment and World Class Hardware Infrastructure.
